Fujitsu PRIMERGY RX600 S6 Quad socket 4 U rack server

Balanced composition of Top Performance and High Availability ensures your growth

The PRIMERGY RX Rack Server family is the perfect platform to form dynamic infrastructures for your business processes today and in the coming decade. You will thus benefit several times over from our recognized experience in optimized data center technology and our innovative strength in developing energy-efficient and cost/performance-optimized rack systems for universal use. PRIMERGY rack servers, built upon industry standards, focus from a functional viewpoint on core features: energy efficiency, reliability, optimized for virtualization, ease of operation and maintenance, flexibility for your future. And thus they notably meet your requirements for outstanding cost efficiency. Optimal operating costs and long-term usability comply with the IT quality required by your customers. Our responsibility goes way beyond the hardware as our tailor-made service packages mean that you can rely on the best support for your IT during its whole lifecycle.

PRIMERGY RX600 S6

Extensive usage of industry standard x86 based platforms is becoming more important than ever: be it as database management system for medium or large-sized databases or as a consolidation basis to run an immensely large number of different applications using virtualization technologies. The scalable PRIMERGY RX600 S6 is in every respect a reliable server for such critical company scenarios. The ideal interaction of integrated redundancy functions with server management components results in high-level availability and constantly efficient IT production as a character feature of this server platform.

The latest generation of Intel Xeon processors

equipped with up to 10 state-of-the-art cores enable a unique performance boost which however does not bear optimal dividends unless paired with other features: a high extendable main memory capacity with up to 64 DIMMs and a very high number of performant PCI Express channels provide a balanced high throughput architecture so as to meet increasing requirements.

This and the continued evolution of virtualization support via Intel® components (processor, I/O controller) enable a greater consolidation of servers and applications with all the market relevant virtualization solutions, resulting in excellent best-in-class efficiency.

Features & Benefits

Main Features	Benefits
<p>Scale-up Performance for Growth</p> <ul style="list-style-type: none"> Using the scalable Intel® QPI architecture in this 4 CPU sockets server results in an excellent increase in performance when compared to the older Front Side Bus server generations. Thanks to the integration of two memory controllers per processor, the CPU to memory bandwidth has been raised up to a factor of 9. Together with the quadrupled maximum memory capacity and the new processor generation with up to 10 cores per processor and 2 threads per core, the system performance achieves unprecedented growth factors. <p>Balanced Scalability</p> <ul style="list-style-type: none"> Balanced scale-up performance is achieved by combining various processor choices, using up to 4 x Intel® Xeon® E7-4800 or up to 2 x Intel® Xeon® E7-2800 processors, with PCI Express Generation 2 I/O busses and up to 64 memory DIMMs on 8 configurable memory boards. <p>Integrated High Availability as standard</p> <ul style="list-style-type: none"> ECC and SDDC memory protection, memory mirroring support, hot-plug Memory Boards with socket-overlapping memory mirroring, hot-plug redundant fans and power supplies as standard, up to 8x hot-plug 2.5-inch SAS/SATA hard disks, hot-plug PCIe slots LocalView display and integrated Remote Management Controller (iRMC S2) IPMI 2.0 as standard 	<ul style="list-style-type: none"> This system is designed for critical corporate applications and large scale consolidation. Its new architecture ensures for even more efficient deployment of demanding scale-up computing needs. Irrespective of the server usage, as database or virtualization system, the performance can always be extended so that no bottlenecks can arise as a result of low processor performance or main memory capacity. More demanding database loads can be hosted on RX600 S6 with peace of mind, capitalizing on high performance I/O, massive computing power and up to 2 TB of local memory. Large scale consolidation of tier 1 and tier 2 workloads into virtual machines benefit from the high platform reliability and its balanced scalability. More consolidation and virtualization efficiency is obtained by using less server instances with the scale-up RX600 S6 platform. Deployment of “fat VMs” for demanding tier 2 applications can be combined with large scale consolidation of tier 1 virtual machines onto significantly less management instances. Enhanced server reliability without extra cost, operational continuity which means more value for your money as well as secured data safety. Secure management control from wherever your experts are located.
